Abstract

Background: Photoshoot booking is a project which can enable customers to book for professional photographers via online. It's difficult for those that want to book for a photography session to request a photographer since the method was done manually. Our online photoshoot booking system is a webpage that permits customers to form photoshoot reservations for the utilization of wedding engagements family portraits then on [1]. In this system involves 2 types of entities which are customers and operators. Customers need to input customers' data and package data for reservation [2]. Our photoshoot booking system takes initiative action to promote their business through social media like Facebook, Instagram [3].

Objective: In the existing system process of booking photography session was done manually by phone calls or drop by at their place. Users can book the photographer anytime and anywhere.

Methodology: The minimum hardware and software requirements needed to run the system efficiently. Software Interface CSS, Bootstrap, Php, Java Script. Many PHP developers utilize email in their code.

Result and Discussion: Booking photography is a system which satisfied the requirement of the user by booking the photographer from their location. This system fulfilled the desire of the users to select the photo shoot at their dream place. The world's largest photo ever taken was 70 billion pixels in Hungary [4].

Conclusion & Future Work: Online Photoshoot Booking Service is the solution for the current generation as it saves the time and effort. It's also a boost for casual photoshoots an increasing the market for the casual photographers. It's saving the money as well because of the competition the platform allowing it to boom.
